WEB Hosting In Windows.

IIS Hosting means hosting a website or web application using **Microsoft IIS (Internet Information Services)**, which is Microsoft's web server that runs on **Windows Server or Windows OS**.

It is mainly used to host:

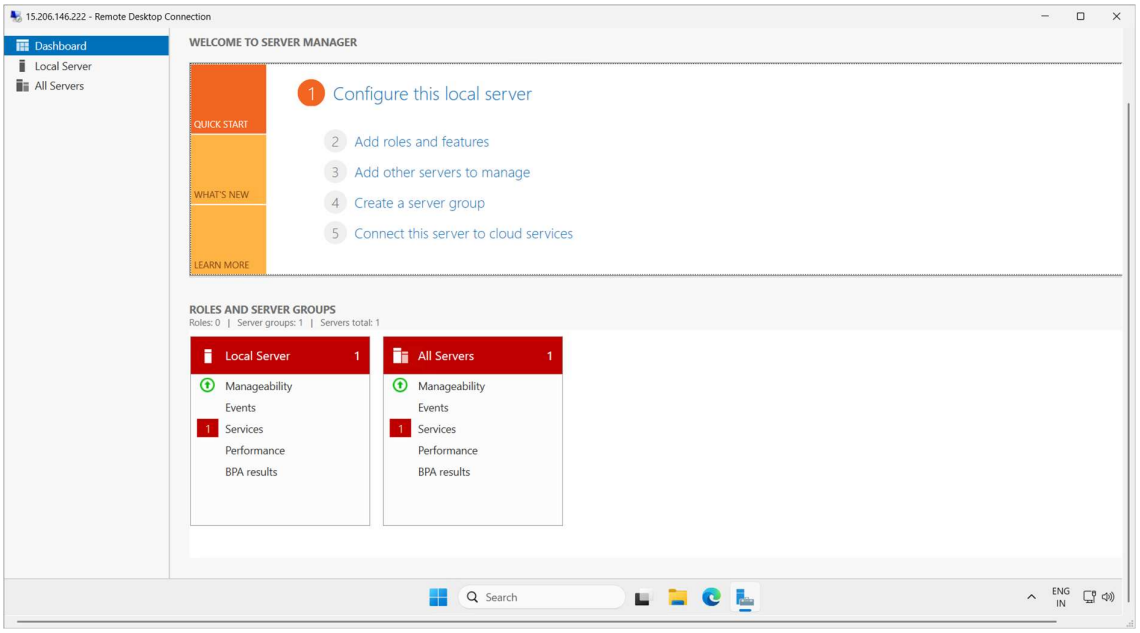
- **ASP.NET / .NET applications**
- **Web APIs**
- **Static websites (HTML, CSS, JS)**
- **Enterprise applications**

1. What IIS Actually Does

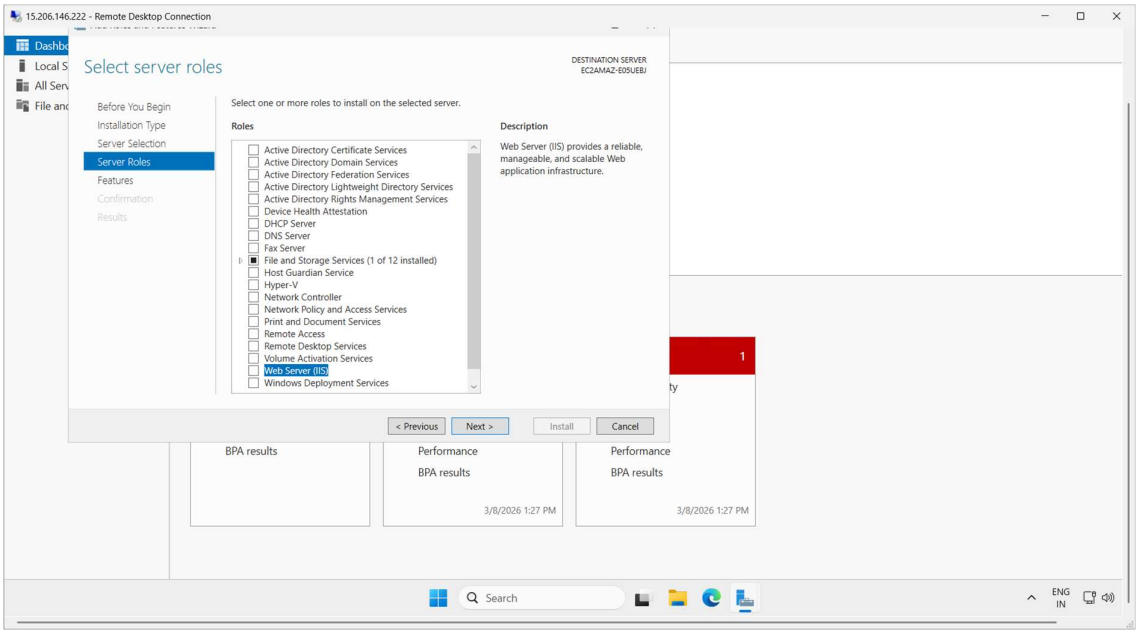
IIS is a **web server**. Its job is simple:

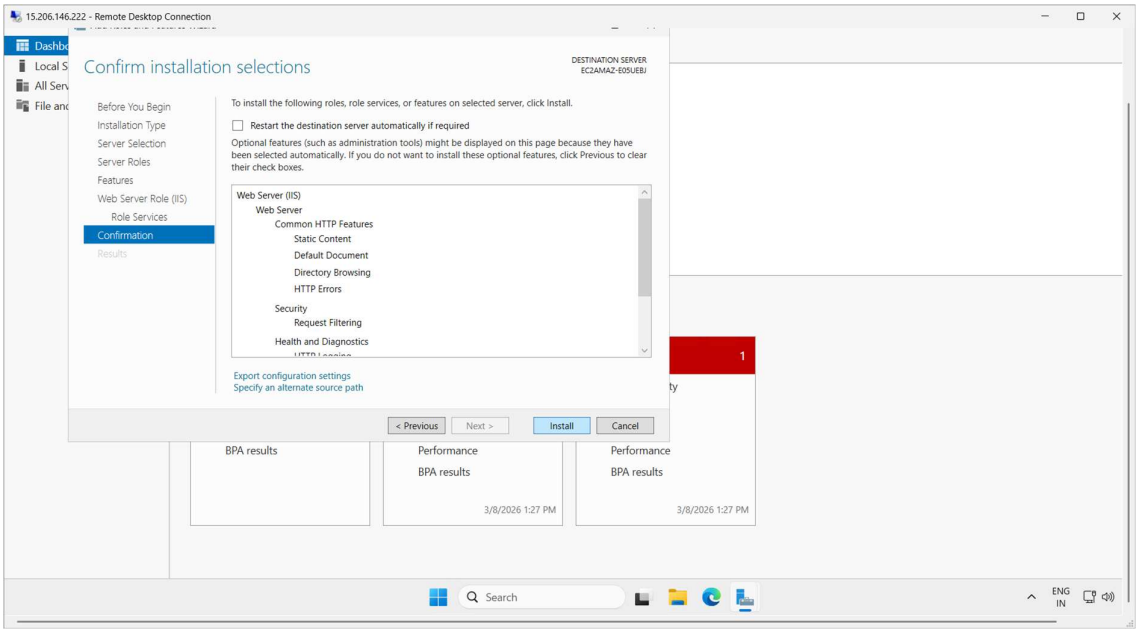
1. A user enters a website URL in the browser
2. The request goes to the server
3. **IIS receives the request**
4. IIS processes it and returns the **web page or data**

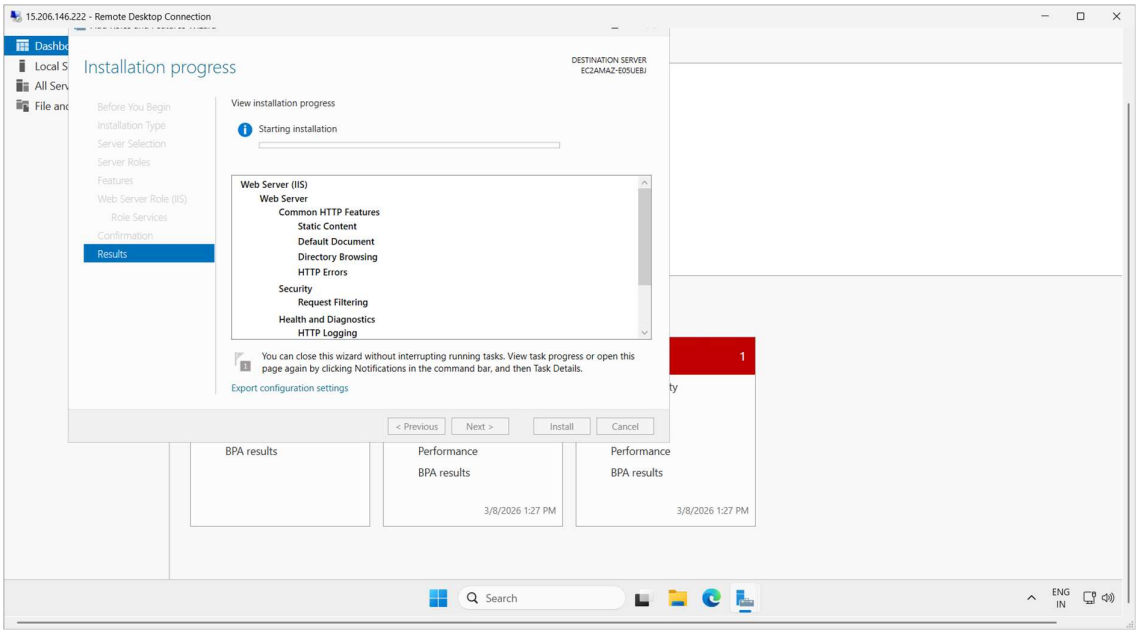
We have to install and configure the IIS (INTERNET INFORMATION SERVICE) using the server manager.



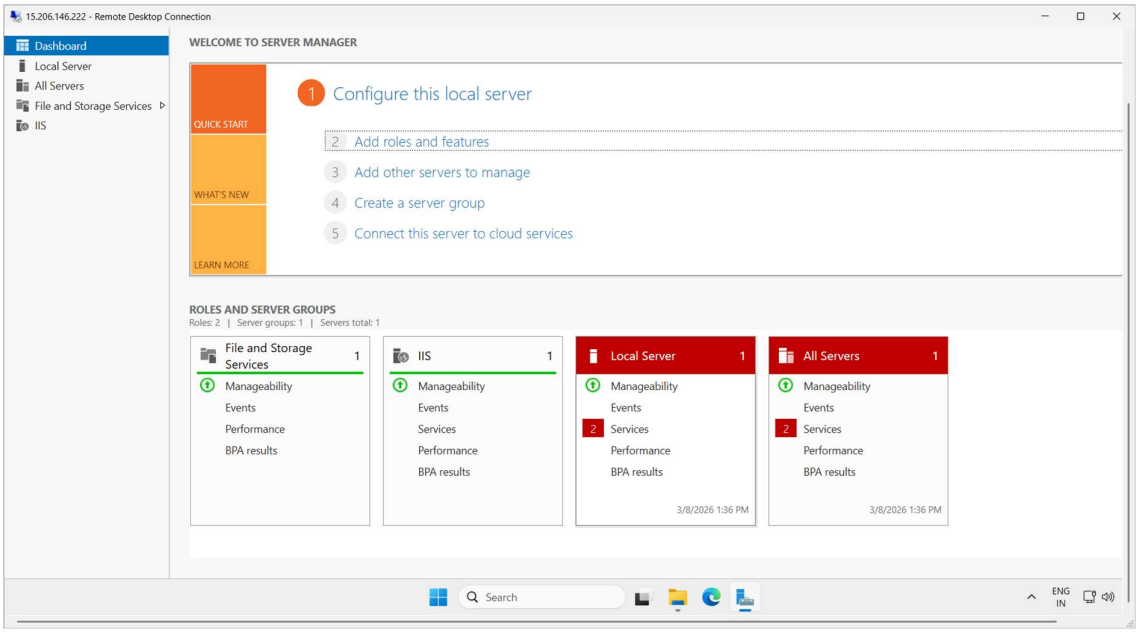
Then we have to select the all the basic config to hosting through the windows.



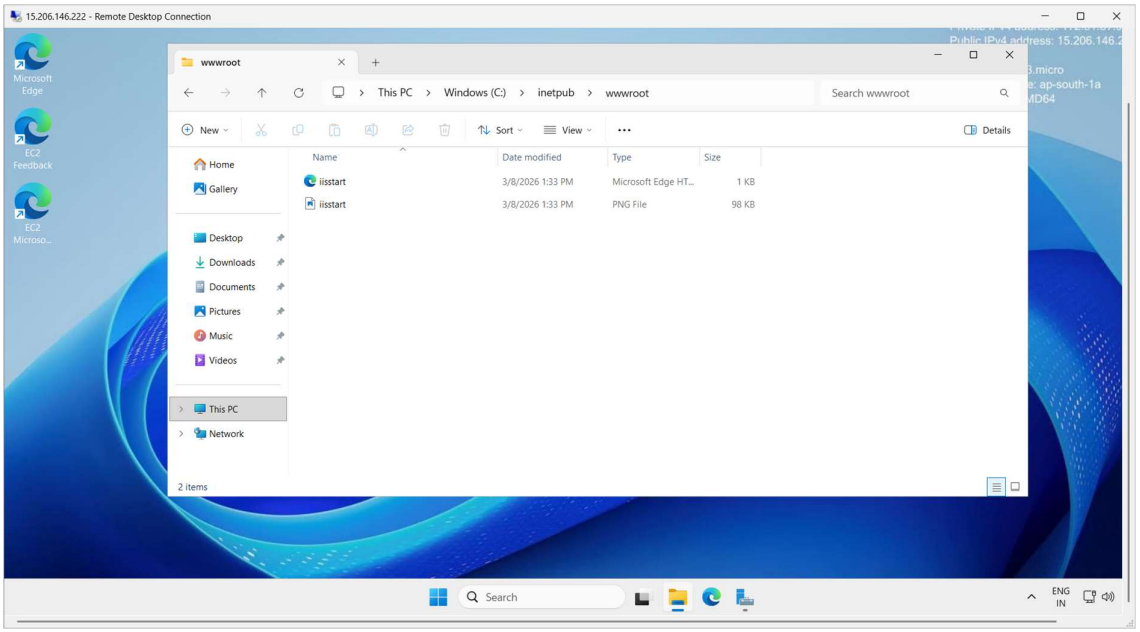




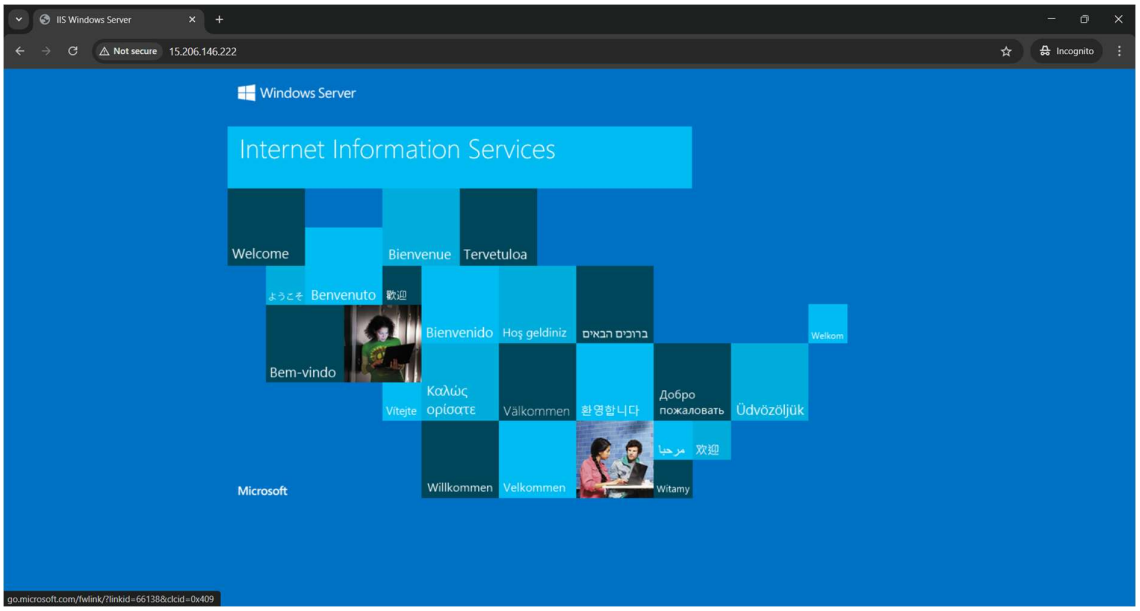
Once the IIS is installed the IIS is hosted automatically.

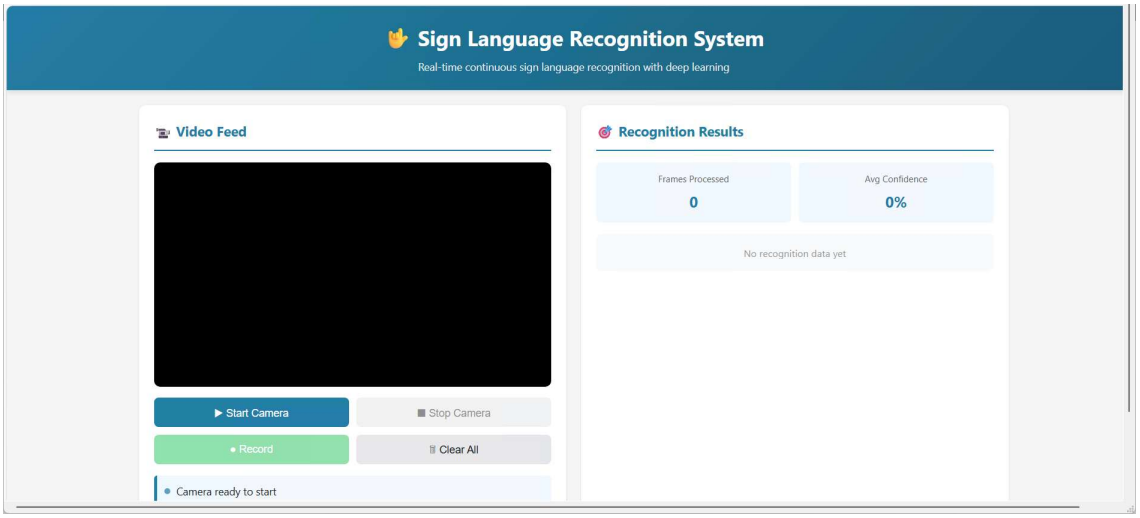


Then the default hosting page path is **inetpub>wwwroot><hosting files>**.



Then we have to copy the public ip to see the hosted web page.



Then I have hosted my project in this IIS with changing the default files.


The hosted web page is …
