AI Tools For DevOps.

1. Amazon CodeGuru

Purpose: AI-powered **code review and performance optimization**.

What it does

- Automatically reviews code for bugs
- Suggests performance improvements
- Detects resource leaks

Used with

- AWS applications
- Java / Python services

Example
If your application has inefficient loops or memory leaks, CodeGuru detects them.

2. Snyk

Purpose: Security scanning for applications and containers.

What it checks

- Open-source dependency vulnerabilities
- Docker image vulnerabilities
- Kubernetes security risks

DevOps usage

- Integrates with CI/CD pipelines
- Scans code before deployment

Example:

snyk test

3. Sysdig

Purpose: Kubernetes monitoring and runtime security.

Key features

- Container security
- Kubernetes monitoring
- Threat detection

Used for

- Detecting suspicious container activity
- Monitoring cluster health

4. Datadog

Purpose: Infrastructure and application monitoring.

What it monitors

- Servers
- Containers
- Databases
- APIs

Important metrics

- CPU
- memory
- latency
- errors

Commonly integrated with:

- AWS
- Kubernetes
- Docker

5. Kubiya

Purpose: AI assistant for **DevOps automation and ChatOps**.

What it does

- Executes infrastructure commands
- Automates DevOps workflows
- Works through chat tools like Slack

Example command:

/deploy production

6. Atlassian Intelligence

Purpose: AI integrated into Atlassian tools.

Works with:

- Jira
- Confluence

Capabilities

- Auto-generate documentation
- AI issue summaries
- Smart task suggestions

7. PagerDuty

Purpose: Incident response automation.

When something breaks in production:

- Sends alerts
- Assigns engineers
- Tracks incident resolution

Example event:

Server CPU > 90% → PagerDuty alert triggered

8. Dynatrace

Purpose: AI-powered monitoring and root cause analysis.

Key feature:

- **Davis AI engine**

It automatically:

- Detects problems
- Identifies root cause
- Suggests fixes

Used heavily in **enterprise production systems**.

9. GitHub Copilot

Purpose: AI assistant that **writes code automatically**.

Common DevOps uses

- Dockerfiles
- Kubernetes YAML
- Bash scripts
- CI/CD pipelines

Example:

create dockerfile for node app

Copilot generates the file automatically.

10. Harness

Purpose: Continuous integration and deployment automation.

Features:

- Smart deployment verification
- Automated rollbacks
- AI risk detection

If deployment fails → automatically rolls back to the previous version.
